Try to learn a concise approximation: $Y \approx QX$, with $Q \in O_n$ and X as sparse as possible.

Try to learn a concise approximation: $Y \approx QX$, with $Q \in O_n$ and X as sparse as possible.

... by solving min $\frac{1}{2} \| \boldsymbol{Y} - \boldsymbol{Q} \boldsymbol{X} \|_{F}^{2} + \lambda \| \boldsymbol{X} \|_{1}$, s.t. $\boldsymbol{Q} \in O_{n}$.

min $f(\boldsymbol{Q}, \boldsymbol{X}) \doteq \frac{1}{2} \|\boldsymbol{Y} - \boldsymbol{Q}\boldsymbol{X}\|_F^2 + \lambda \|\boldsymbol{X}\|_1$, s.t. $\boldsymbol{Q} \in O_n$.

- Objective is **nonconvex**: $(Q, X) \mapsto QX$ is bilinear
- Combinatorially many isolated global minima: (Q, X) or (QΠ, Π*X) (2ⁿn! many signed permutations Π)
- Orthogonal group O_n is a **nonconvex** set

Sun, Qu, and Wright Complete Dictionary Recovery over the Sphere

Working hypothesis

Certain nonconvex optimization problems become tractable when the input data are large and random (generic).

A Geometric Approach

Geometry of the function landscape determines algorithm design and analysis.

... starting with sparse dictionary learning!

Towards geometric understanding

Model problem

min
$$\frac{1}{p} \| \boldsymbol{q}^* \boldsymbol{Y} \|_1 = \frac{1}{p} \sum_{i=1}^p | \boldsymbol{q}^* \boldsymbol{y}_i |$$
 s.t. $\| \boldsymbol{q} \|_2^2 = 1$. $\boldsymbol{Y} \in \mathbb{R}^{n \times p}$

Slightly modified model problem

min
$$\frac{1}{p}\sum_{i=1}^{p}h_{\mu}\left(\boldsymbol{q}^{*}\boldsymbol{y}_{i}\right)$$
 s.t. $\|\boldsymbol{q}\|_{2}^{2}=1$. $\boldsymbol{Y}\in\mathbb{R}^{n\times p}$

• Work with a *smooth surrogate* for |z|:

$$h_{\mu}\left(z\right) = \mu \log \frac{e^{z/\mu} + e^{-z/\mu}}{2} = \mu \log \cosh \frac{z}{\mu}$$

 Recognize the objective as a *normalized* sum of independent random variables → expectation, asymptotically

Why might this work?

A low-dimensional example (n = 3) of the landscape when $p \rightarrow \infty$

Every local minimizer is a target!

(I) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

In high dimensions ... details

Assuming $A_0 = I$... **Proposition**: Suppose $\theta \in (0, \frac{1}{2})$, and $\mu < \min \{cn^{-5/4}, c'\theta n^{-1}\}$. Then

• $\nabla^{2}\mathbb{E}\left[g\left(\boldsymbol{w}\right)\right] \succeq c_{\star}\frac{\theta}{\mu}\boldsymbol{I}$, for $\|\boldsymbol{w}\| \leq \frac{\mu}{4\sqrt{2}}$ • $\frac{\boldsymbol{w}^{*}\nabla\mathbb{E}\left[g\left(\boldsymbol{w}\right)\right]}{\|\boldsymbol{w}\|} \geq c_{\star}\theta$, for $\frac{\mu}{4\sqrt{2}} \leq \|\boldsymbol{w}\| \leq R$ • $\frac{\boldsymbol{w}^{*}\nabla\mathbb{E}\left[g\left(\boldsymbol{w}\right)\right]\boldsymbol{w}}{\|\boldsymbol{w}\|^{2}} \leq -c_{\star}\theta$, for $\|\boldsymbol{w}\| \geq R$ $(R = \Theta(1))$.

and so, every local minimizer of $\mathbb{E}\left[g\left(w
ight)
ight]$ is a target point. Doctor 17/26

Convergence in function landscape

When does the finite-sample objective **converge** to the asymptotic one, in optimization sense?

...informally, is the function geometry "nice" for some large yet finite *p*?

• • • • • • • • • • • •

Finite-sample result

- Objective $g(\boldsymbol{w}) = \frac{1}{p} \sum_{i=1}^{p} h_{\mu} (q(\boldsymbol{w})^* \boldsymbol{x}_i)$ is a sum of independent RVs.
- The proof follows a typical expectation-concentration path

Theorem

Suppose $\theta \in (0, \frac{1}{2})$, if $\mu < \min\{cn^{-5/4}, c'n^{-1}\}$, and $p \ge \frac{Cn^3}{\mu^2\theta^2} \log \frac{n}{\mu\theta}$, it holds uniformly w.h.p. that

•
$$\nabla^2 g(\boldsymbol{w}) \succeq c_\star \frac{\theta}{\mu} \boldsymbol{I}$$
, for $\|\boldsymbol{w}\| \leq \frac{\mu}{4\sqrt{2}}$

- $\frac{\boldsymbol{w}^* \nabla g(\boldsymbol{w})}{\|\boldsymbol{w}\|} \ge c_\star \theta$, for $\frac{\mu}{4\sqrt{2}} \le \|\boldsymbol{w}\| \le R$
- $\bullet \ \ \frac{\boldsymbol{w}^{*} \nabla g(\boldsymbol{w}) \boldsymbol{w}}{\|\boldsymbol{w}\|^{2}} \leq -c_{\star} \theta, \quad \text{for } \|\boldsymbol{w}\| \geq R \ (R = \Theta \ (1)).$

... following intuition we build from the geometry:

- No spurious local minimizers descent algorithm with an arbitrary initial point
- Need to escape saddle points ⇒ Use second-order information. Here, via the trust region method.

Trust-region on manifolds [Absil, Baker, Gallivan. '07], also [Absil, Mahoney, Sepulchre. '08]

イロト イポト イヨト イヨト

Trust region method - Riemannian Manifold

$$\widehat{f}(\boldsymbol{\delta}; \boldsymbol{x}_k) = f(\boldsymbol{x}_k) + \langle \nabla f(\boldsymbol{x}_k), \boldsymbol{\delta} \rangle + \frac{1}{2} \boldsymbol{\delta}^* \boldsymbol{B}_k \boldsymbol{\delta}.$$

$$\exp_{\boldsymbol{q}}(\boldsymbol{\delta}) = \boldsymbol{q} \cos \|\boldsymbol{\delta}\| + \frac{\boldsymbol{\delta}}{\|\boldsymbol{\delta}\|} \sin \|\boldsymbol{\delta}\|$$

- Consider a function $f : \mathbb{S}^{n-1} \to \mathbb{R}$. For $q \in \mathbb{S}^{n-1}$ and $\delta \in T_q \mathbb{S}^{n-1}$. Define the function $f_q : T_q \mathbb{S}^{n-1} \to \mathbb{R}$ as $f_q \doteq f(\exp_q(\delta))$.
- Taylor's theorem implies

$$f(\exp_{\boldsymbol{q}}(\boldsymbol{\delta})) = f(\boldsymbol{q}) + \langle \boldsymbol{\delta}, \nabla f(\boldsymbol{q}) \rangle + \frac{1}{2} \boldsymbol{\delta}^* (\nabla^2 f(\boldsymbol{q}) - \langle \boldsymbol{q}, \nabla f(\boldsymbol{q}) \rangle \boldsymbol{I}) \boldsymbol{\delta} + O(\|\boldsymbol{\delta}\|^3)$$

$$\doteq f_{\boldsymbol{q}}(\boldsymbol{\delta}; \boldsymbol{q}) + O(\|\boldsymbol{\delta}\|^3).$$

• Basic Riemannian trust-region method:

$$\begin{split} \delta_{\star} &\in \argmin_{\delta \in T_{\boldsymbol{q}_k} \mathbb{S}^{n-1}, \|\delta\| \leq \Delta} \widehat{f}_{\boldsymbol{q}_k}(\delta; \boldsymbol{q}_k) \\ \boldsymbol{q}_{k+1} &= \exp_{\boldsymbol{q}_k}(\delta_{\star}). \end{split}$$

Theorem (informal, exact recovery for complete dictionaries)

For any $\theta \in (0, 1/3)$, given $\mathbf{Y} = \mathbf{A}_0 \mathbf{X}_0$ with \mathbf{A}_0 a complete dictionary and $\mathbf{X}_0 \sim_{i.i.d.} BG(\theta)$, there is a polynomial-time algorithm that recovers \mathbf{A}_0 and \mathbf{X}_0 with high probability (at least $1 - O(p^{-6})$) whenever $p \ge p_{\star}(n, 1/\theta, \kappa(\mathbf{A}_0), 1/\mu)$ for a fixed polynomial $p_{\star}(\cdot)$, where $\kappa(\mathbf{A}_0)$ is the condition number of \mathbf{A}_0 and μ is the smoothing parameter.

Comparison with the Literature

• Efficient algorithms with performance guarantees

[Spielman, Wang, Wright,'12] [Agarwal, Anandkumar, Netrapali, '13] $\mathbf{Q} \in \mathbb{R}^{m \times n}$ $(m < n), \theta = \tilde{O}(1/\sqrt{n})$ [Arora, Ge, Moitra,'13] [Arora, Ge, Ma, Moitra, 15]

 $\boldsymbol{Q} \in \mathbb{R}^{n \times n}, \theta = \tilde{O}\left(1/\sqrt{n}\right)$ $\boldsymbol{Q} \in \mathbb{R}^{m \times n} \ (m < n), \ \theta = \tilde{O} \left(1/\sqrt{n} \right)$ $\boldsymbol{Q} \in \mathbb{R}^{m \times n} \ (m < n), \ \theta = \tilde{O} \ (1/\sqrt{n})$

<ロト <回ト < 回ト < 回ト < 回ト = 回 -

Quasipolynomial algorithms with better guarantees [Arora, Bhaskara, Ge, Ma,'14] different prob. model, $\theta = O(1/\text{polylog}(n))$ sum-of-squares, $\theta = \tilde{O}(1)$ [Barak, Kelner, Steurer,'14]

 Other theoretic work on local geometry: [Gribonval, Schnass'11], [Geng, Wright, '11], [Schnass'14], [Schnass'15]

This work: a polynomial algorithm for squared Q, $\theta = O(1)$.

What we have done ...

min
$$\frac{1}{p}\sum_{i=1}^{p}h_{\mu}\left(\boldsymbol{q}^{*}\boldsymbol{y}_{i}\right)$$
 s.t. $\|\boldsymbol{q}\|_{2}^{2}=1$. $\boldsymbol{Y}\in\mathbb{R}^{n\times p}$

- Prove as *p* becomes **large**, the nonconvex program becomes tractable under our **probabilistic setting**.
- Geometry has guided our analysis and algorithm design.

• • • • • • • • • • • •

Prior work: proving nonconvex recovery

- Matrix completion/recovery: [Keshevan, Oh, Montanari.'09], [Jain, Netrapali, Sanghavi. '13], [Hardt'13], [Hardt, Wooters. '14], [Netrapalli et al. '14], [Jain + Netrapalli,'14], [Zheng + Lafferty. '15]. Also [Meta, Jain, Dhillon.'09]
- Dictionary learning: [Agarwal, Anandkumar, Netrapali. '13], [Arora, Ge, Moitra. '13], [Agarwal, Anandkumar, Jain, Netrapali.'13], [Arora, Ge, Ma, Moitra. '15]
